INZIVO ARCHITECTURE

What it costs to run Inzivo

Monthly running cost of the current setup, what drives it, and how it grows with the number of employees. All amounts are in Indian rupees (INR), converted from list prices at INR 96.8 per US dollar (live rate on 10 Oct 2026), and should be confirmed against the actual bills.

INR 11,200 - 13,800	INR 550	INR 140
per month today	per employee per month, at 25 employees	per employee per month, at 100 employees

How the system is put together

Every box below is a service we pay for or run. People and phones at the top talk to the server; the server uses the services below it.

Employee phone Android app (APK built with Expo)	**Admin browser** Company admins use the web console	**Website visitors** Landing page and signup
HTTPS / HTTP	HTTPS	HTTPS
AWS EC2 server (ARM, 4 CPU, 8 GB) nginx + Inzivo app (Next.js) + face recognition service, on one machine	**Supabase PostgreSQL (Tokyo)** All company data, attendance, locations, photos	**MongoDB Atlas** Saved face data (small)
Resend Activation and password-reset email	**Expo push service** Notifications to phones	**OpenStreetMap / Esri** Map tiles and place names

The face service moved onto the same server as the app, so face checks no longer depend on a separate office PC.

MONTHLY COST

Where the money goes today

Low assumes free tiers where they exist. Likely is the working number for the meeting.

Component	What it does	Low (INR)	Likely (INR)
AWS EC2 server, 4 CPU ARM, 8 GB	Runs the app, nginx and the face service	9,680	9,680
AWS disk (123 GB SSD)	Operating system, app, logs	970	970
AWS public IP and data out	Fixed address, traffic to phones and browsers	390	580
Supabase PostgreSQL	Main database. The free plan is 500 MB, which photos can fill; Pro is about INR 2,420 a month with 8 GB	0	2,420
MongoDB Atlas	Face data. A few KB per person, fits the free tier	0	0
Resend email	Free up to 3,000 emails a month; Pro is about INR 1,940	0	0
Expo (builds and push)	Free plan builds are slow but work; push messages are free	0	0
Domain name	About INR 1,450 a year	120	120
SSL certificate, GitHub, maps	Free (Lets Encrypt, free GitHub plan, OpenStreetMap and Esri tiles)	0	0
Total per month		**11,160**	**13,770**

The server is the biggest cost (about 80 percent). Everything else sits on free plans, which is why the total is low for a product with a mobile app, face recognition and live tracking.

Cost per employee

Employees	**25**	**100**	**250**	**500**
Server	9,680	9,680	9,680	19,360 (bigger machine)
Database	2,420	2,420	2,420 - 4,840	4,840 - 7,260
Other (disk, IP, domain, email)	1,670	1,670	3,610 (Resend Pro)	3,610 (Resend Pro)
Total per month (INR)	**13,770**	**13,770**	**15,710 - 18,130**	**27,810 - 30,230**
Per employee per month (INR)	**551**	**138**	**63 - 73**	**56 - 60**

Costs barely move until roughly 250 employees, so the cost per employee falls quickly as the customer base grows. Compare these numbers with the price of your plans to see the margin.

NEW CUSTOMER

Adding a new organization with 100 employees

What stays the same, what to upgrade first, and what it adds to the monthly bill.

Stays as it is	The AWS server (4 CPU, 8 GB) handles 100 more employees, including face checks and field tracking. The face service, MongoDB, the app build and push messages need no change. The same APK works for every organization (they type their own organization code).

What to upgrade before going live

Upgrade	Why	Extra per month (INR)
Supabase database to the Pro plan	The free plan holds only 500 MB and pauses when quiet. 100 employees add about 1.3 GB of photos (kept 45 days) and, if 30 are field workers, about 260 MB of location data a month. Pro gives 8 GB and daily backups.	2,420
Server backups (disk snapshots)	A copy of the server disk so it can be restored if it fails. Billed on the data used, a few GB.	300
Verified email sending domain	Without it, activation and password-reset emails reach only the owner address, so the admin of the new organization would not get theirs. Verifying a domain is free on the current Resend plan.	0
Location data clean-up rule	Delete detailed location points after about 90 days so the database stays inside 8 GB. A one-time code change, no running cost.	0
Total added		**2,720**

	Today (free database)	Already on Pro
Monthly cost now	11,160	13,770
After adding the 100-employee organization	13,880	14,070
Cost of that organization alone	2,720	300
Per employee (that organization)	27	3

The running cost of one more organization is small because the server has room. The real work is onboarding and support, which is not included here.

Optional upgrades as you grow

MongoDB Atlas paid tier	Adds backups for the saved face data. About INR 5,500 a month. Worth it once many organizations depend on face checks.
Google Play listing	One-time registration of about INR 2,400 if you want employees to install from the Play Store instead of an APK file.
Payment gateway	No monthly fee. About 2 to 3 percent of each payment collected from customers.
Bigger server	Only if several hundred field workers send data at once. About INR 9,700 a month more for the next size up.

WHAT CHANGES THE BILL

Cost drivers and how to keep them low

Photos in the database	Check-in and visit photos are stored in PostgreSQL for 45 days (about 13 MB per employee per month). This is what will push Supabase from the free plan to Pro, then to extra storage at about INR 12 per GB.
Location points	A field worker records a point every 10 seconds, about 2,900 rows a day. 50 field workers add roughly 430 MB a month. There is no clean-up yet, so adding a retention rule (for example delete detailed points after 90 days) keeps this flat.
Mobile data (employee side)	About 0.6 MB a day per field worker for location. Employees pay nothing extra; this is only a note for the sales pitch.
Server size	The 4 CPU machine handles the face checks and 250 employees comfortably. It only needs to grow for several hundred field workers sending data at the same time.
Email	Free for 3,000 emails a month. A verified sending domain is still pending; Resend Pro (about INR 1,940 a month) is only needed if volume grows.
Real payment gateway	Not built yet. Gateways charge per transaction (typically 2 to 3 percent), not a monthly fee, so it adds no fixed cost.

Ways to reduce cost

Reserve the server	A 1-year reserved or savings-plan commitment on AWS usually cuts the server price by 30 to 40 percent (INR 9,680 to about INR 6,300 a month).
Right-size the machine	If usage stays small, a 2 CPU ARM machine (about INR 4,800 to 5,800) is enough and saves about INR 3,900 a month.
Move photos out of the database	Storing photos in cheap object storage (about INR 2 per GB) keeps the database small and is the cheapest way to scale.
Keep free tiers	MongoDB, Resend, Expo, GitHub and the map services stay at zero for a long time at this size.

To confirm before quoting these numbers

These are estimates from list prices. Check three things on the real accounts: the exact AWS machine type and region (prices differ by region), the Supabase plan in use, and the MongoDB Atlas tier. Developer time is not included in the running cost.
