INZIVO ARCHITECTURE

What it costs to run Inzivo

Monthly running cost of the current setup, what drives it, and how it grows with the number of employees. Figures are list-price estimates in US dollars (INR at 88 per USD) and should be confirmed against the actual bills.

USD 115 - 142	USD 5.7	USD 1.4
per month today (INR 10,120 - 12,496)	per employee per month at 25 employees	per employee per month at 100 employees

How the system is put together

Every box below is a service we pay for or run. People and phones at the top talk to the server; the server uses the services below it.

Employee phone Android app (APK built with Expo)	**Admin browser** Company admins use the web console	**Website visitors** Landing page and signup
HTTPS / HTTP	HTTPS	HTTPS
AWS EC2 server (ARM, 4 CPU, 8 GB) nginx + Inzivo app (Next.js) + face recognition service, on one machine	**Supabase PostgreSQL (Tokyo)** All company data, attendance, locations, photos	**MongoDB Atlas** Saved face data (small)
Resend Activation and password-reset email	**Expo push service** Notifications to phones	**OpenStreetMap / Esri** Map tiles and place names

The face service moved onto the same server as the app, so face checks no longer depend on a separate office PC.

MONTHLY COST

Where the money goes today

Low assumes free tiers where they exist. Likely is the working number for the meeting.

Component	What it does	Low (USD)	Likely (USD)
AWS EC2 server, 4 CPU ARM, 8 GB	Runs the app, nginx and the face service	100	100
AWS disk (123 GB SSD)	Operating system, app, logs	10	10
AWS public IP and data out	Fixed address, traffic to phones and browsers	4	6
Supabase PostgreSQL	Main database. The free plan is 500 MB, which photos can fill; Pro is USD 25 with 8 GB	0	25
MongoDB Atlas	Face data. A few KB per person, fits the free tier	0	0
Resend email	Free up to 3,000 emails a month; Pro is USD 20	0	0
Expo (builds and push)	Free plan builds are slow but work; push messages are free	0	0
Domain name	About USD 15 a year	1	1
SSL certificate, GitHub, maps	Free (Let's Encrypt, free GitHub plan, OpenStreetMap and Esri tiles)	0	0
Total per month		**115**	**142**
In INR (at 88)		10,120	12,496

The server is the biggest cost (about 80 percent). Everything else sits on free plans, which is why the total is low for a product with a mobile app, face recognition and live tracking.

Cost per employee

Employees	**25**	**100**	**250**	**500**
Server	100	100	100	200 (bigger machine)
Database	25	25	25 - 50	50 - 75
Other (disk, IP, domain, email)	17	17	37 (Resend Pro)	37 (Resend Pro)
Total per month (USD)	**142**	**142**	**162 - 187**	**287 - 312**
Per employee (USD)	**5.7**	**1.4**	**0.65 - 0.75**	**0.57 - 0.62**
Per employee (INR)	**502**	**123**	**57 - 66**	**50 - 55**

Costs barely move until roughly 250 employees, so the cost per employee falls quickly as the customer base grows. Compare these numbers with the price of your plans to see the margin.

WHAT CHANGES THE BILL

Cost drivers and how to keep them low

Photos in the database	Check-in and visit photos are stored in PostgreSQL for 45 days (about 13 MB per employee per month). This is what will push Supabase from the free plan to Pro, then to extra storage at about USD 0.125 per GB.
Location points	A field worker records a point every 10 seconds, about 2,900 rows a day. 50 field workers add roughly 430 MB a month. There is no clean-up yet, so adding a retention rule (for example delete detailed points after 90 days) keeps this flat.
Mobile data (employee side)	About 0.6 MB a day per field worker for location. Employees pay nothing extra; this is only a note for the sales pitch.
Server size	The 4 CPU machine handles the face checks and 250 employees comfortably. It only needs to grow for several hundred field workers sending data at the same time.
Email	Free for 3,000 emails a month. A verified sending domain is still pending; Resend Pro (USD 20) is only needed if volume grows.
Real payment gateway	Not built yet. Gateways charge per transaction (typically 2 to 3 percent), not a monthly fee, so it adds no fixed cost.

Ways to reduce cost

Reserve the server	A 1-year reserved or savings-plan commitment on AWS usually cuts the server price by 30 to 40 percent (USD 100 to about USD 65).
Right-size the machine	If usage stays small, a 2 CPU ARM machine (about USD 50 to 60) is enough and saves about USD 40 a month.
Move photos out of the database	Storing photos in cheap object storage (about USD 0.023 per GB) keeps the database small and is the cheapest way to scale.
Keep free tiers	MongoDB, Resend, Expo, GitHub and the map services stay at zero for a long time at this size.

To confirm before quoting these numbers

These are estimates from list prices. Check three things on the real accounts: the exact AWS machine type and region (prices differ by region), the Supabase plan in use, and the MongoDB Atlas tier. Developer time is not included in the running cost.
