INZIVO

Project feature overview

Inzivo is a multi-company attendance and field-force platform. Companies sign up on the website, their admins run everything from a web console, and their employees check in from a mobile app or a shared kiosk. This document lists every feature built so far, grouped by the part of the system it belongs to.

1. Marketing website
Landing page, signup, payment and sign-in.

2. Admin console (web)
Dashboard, employees, shifts, leave, field workers, settings.

3. Employee mobile app
Check-in, field visits, requests, live tracking.

4. Backend and services
API, database, face verification, email, alerts.

5. Reports and exports
Excel field report, CSV, accuracy and data-usage reports.

6. Hosting and operations
Server, builds, security and scheduled jobs.

PART 1

Marketing website

The public site where a new company finds Inzivo and signs up (Next.js).

Landing page	Product overview, how it works, feature sections, admin-console preview and pricing.
Plan signup	Plan cards with feature lists, seat count, monthly or yearly billing and a live order summary.
Payment step	A development payment page and completion page that confirm the order and create the organization. A real payment gateway is planned but on hold.
Account activation	After payment the admin receives an email with an activation link and sets their password.
Sign in	Return sign-in that hands the admin over to the console on the app domain with a fresh-login check.

PART 2

Admin console (web)

The control room for each company, with a sidebar layout, light and dark themes and a guided first-run tour.

Dashboard	Greeting, live counts (total, working now, late, on leave), a stacked "today at a glance" bar and the Team today table with filters and search.
Dashboard alerts	"Tracking stopped" card for field workers whose phone went silent, "Missed face checks" for the last 7 days, and a face-service status banner that clears itself.
Permission requests	Approve or decline timed-permission requests right from the dashboard.
Employees	Add one employee, or bulk add up to 500 by uploading a CSV (drag and drop, template download, row-by-row validation). Work modes: Office, Work from home, Field. Auto-generated IDs and PINs, PIN reset, deactivate and archive.
Employee profile	Banner profile, attendance calendar with day details, late marks, face-check badges and photos.
Shifts	Shift cards with start and end times; assign employees to shifts per weekday. Lateness is measured against the shift.
Leave	Approve or reject leave requests, mark leave on someone's behalf, manage the company holiday calendar and annual leave quotas.
Overtime	See who is working overtime now, and review completed sessions with work summaries and photos.
Support	Issues employees report from the app (with screenshots) land here to resolve.
Office location	Pin the office on a map, set the allowed check-in radius, and give work-from-home employees their own home location.
Settings	Check-out photo required, reimbursement rate per km, leave quotas, lateness cutoff, organization code, plan and seats, other admins, and API keys.
Theme and layout	Collapsible icon sidebar, mobile drawer, light and dark theme with a slow fade, and a "Take a tour" guided walkthrough.

PART 2 CONTINUED

Field workers page

Everything about people who work outside the office.

Day view	Pick any worker and date (calendar popover with dots on field days). Headline tiles: places covered, distance travelled, start time and field hours.
Map	Numbered stops, a green start flag, last-seen marker, direction arrows, km markers, hover read-out of time and distance, scale bar, stop-name labels, and a Street / Satellite layer switch.
Journey list	Each place with arrival and leaving times, time spent and description; click a stop to fly the map to it.
Merged places	Many GPS stops near one site are merged into one place so the map does not fill with pins.
Visit details	Contact person, phone, email and remarks the employee logged, plus site photos.
Tracking gaps	Silences longer than 5 minutes are drawn dashed, left out of the GPS distance, and explained in a warning with coverage percentage.
Odometer and reimbursement	Start and end km entered by the employee, GPS versus odometer distance, and a reimbursement form (rate, amount, note) calculated from either.

PART 3

Employee mobile app (Android, Expo / React Native)

The app employees carry: check in, work, request, check out.

Sign in	Organization code, employee code and PIN; the organization code is remembered. Optional biometric unlock.
Face enrolment	First-login selfie that is saved to the face service for later check-in verification.
Dashboard	Presence card with live working time, geofence distance, leave balance, recent history, weekly hours, late and leave notices, and pull to refresh.
Check in and out	Office / Field work picker (Home / Office for work-from-home staff), presence photo, 6-box PIN entry, slide to confirm, and a clear dialog when something is blocked. Takes you to the Dashboard after check-in.
Start and end km	Field workers enter the vehicle odometer at check-in and check-out; the end cannot be lower than the start.
Field visits	Log each place with name, description, contact person, phone, email, remarks and a site photo. Saves in the background with Saving, Retry and Remove states.
Field and Office switching	Automatic switch when the worker reaches or leaves the office (about 4 to 6 minutes), plus an "I'm actually in Office / Field" button.
Live map	Shows your position, today's route and logged locations.
Requests	Leave, timed permission and overtime submitted from slide-up sheets, with status and cancel for pending leave.

Profile	History, change PIN, profile photo, and "Help and report an issue" with an optional screenshot.
Camera	Android-style round shutter button; photos are shrunk on the phone so uploads are fast.
Notifications	Shift reminders, a warning when you leave the work area, and a reminder when location sharing stops.

PART 3 CONTINUED

Location tracking in the app

How the route and distance are recorded.

Background tracking	Foreground-service location while checked in. Field workers sample the GPS every 10 seconds and upload in one batch with the regular 2-minute ping, which keeps data use near 0.6 MB a day.
Keep tracking alive	At check-in the app checks "Allow all the time" and battery-saver status and opens the right phone settings; it restarts tracking if the phone stops it and keeps unsent points on disk.
Fix now	A prominent Dashboard banner and a guided "Keep location sharing on" sheet.
Mock-location guard	Fake GPS readings are rejected at check-in and ignored during tracking.

PART 4

Backend, data and services

One Next.js application serves the admin site and the APIs; PostgreSQL stores the data.

Multi-company (tenants)	Every company is an organization with its own slug, employees, office, settings, shifts and holidays; people are scoped to their organization everywhere.
Authentication	NextAuth for admins (password), PIN for employees, signed mobile tokens with refresh, per-tab security, and a safe cross-site sign-in handoff.
Check-in rules	One check-in and one check-out a day, geofence for office days, work-mode rules, late-minute calculation against the shift, approved-leave block, and auto-close of forgotten check-ins.
Face verification	A separate InsightFace service (embeddings in MongoDB) now runs on the same server as the app. Duplicate-face and quality checks; if the service is down, check-ins still go through and are flagged.
Auto-pause	When a worker stays outside the work area, time is paused after a confirmed streak and a grace period, with a push warning.
Timed permissions and overtime	Self-declared pauses and overtime requests with summary and photo; auto check-out when a permission runs past shift end.
Odometer and contacts	Start and end km on attendance, and contact fields on each field visit, stored and exposed to the admin.
Tracking watch	A scheduled job finds checked-in field workers whose phone stopped sending location and nudges them by push; the dashboard lists them.

Place names	Reverse geocoding through OpenStreetMap with a cache, throttled to respect the free service.
Photos	Stored compressed, cleared after 45 days, with a flag so no page asks for a photo that is gone.
Public API	API-key based endpoints for companies to connect their own tools; keys are created and revoked in Settings.
Rate limits	Request and PIN-guess limits per IP and per employee code across the kiosk, mobile and web.

PART 4 CONTINUED

Email and billing

Transactional email and subscription handling.

Email (Resend)	Activation and password-reset emails with an illustrated, email-safe design and inline images.
Password reset	Request link by email, set a new password, then sign in again.
Plans and seats	Plan tier and seat limit per organization, change-plan flow from Settings, and a payment-webhook path ready for a real gateway.
Kiosk	A shared web check-in screen per company (by organization slug) using employee code, PIN and photo.

PART 5

Reports and exports

Ways to get data out of the system.

Excel field report	Choose several employees and a date range (up to 31 days): Daily summary, Logged stops and Detected stops sheets with times, distances, odometer, contacts, remarks, map links, tracking coverage and a "use the odometer" flag.
Accuracy records	GPS versus odometer difference and percentage, ping interval and point count per day.
Attendance CSV	Export of the team attendance table from the dashboard.
Analysis reports	A tracking accuracy and data-usage report, a field-app performance report, and a step-by-step field employee guide.

PART 6

Hosting, security and operations

How it is run.

Server	AWS Ubuntu server (ARM) running the Next.js app behind nginx on the company domain, with the face service as a boot-time system service.
Mobile builds	Android APKs built in the cloud with Expo (EAS), with environment settings for server address and default organization code.
Security headers	Content security policy, frame protection and related headers on every response.

Scheduled jobs	A 5-minute scheduler on the server calls the tracking-watch job with a shared secret.
Health checks	A health page reports database and face-service status for monitoring.
Documentation	In-app first-run tour for admins and a printable field guide for employees.

Status notes

On hold: real payment gateway, verified sending domain for email. In progress or recent: tracking-stopped alerts, mobile tracking hardening, richer field map. This list reflects the code as of 10 October 2026.
